❖ INPUTS & OUTPUTS DEVICES :

Input and output devices allow the computer system to interact with the outside world by moving data *into* and *out* of the system. An *input device* is used to bring data into the system. Some input devices are:

- Keyboard
- Mouse
- Microphone
- Bar code reader
- Graphics tablet

An *output device* is used to send data out of the system. Some output devices are:

- Monitor
- Printer
- Speaker

❖ IMPORTANCE:

The computer will be of no utilization except if it can speak with the outside world. Input and Output devices are required for clients to speak with the computer. In straight forward terms, input devices carry data into the computer, and output devices bring data out of a computer framework. These input/output devices are otherwise called peripherals since they encase the CPU and memory of a computer framework.

Input and output allude to the correspondence between a data handling framework, (for example, a computer), and the outside world. Inputs are the signs or information sent to the framework, and output is the signs or information sent by the framework to the outside.

Prof. Sayyad S.M. Delivering the Lecture.
